Unusual Fire and Explosion Hazards:

Most vinyl compounds will not support combustion because they require a higher concentration of oxygen for burning than is present in the earth's atmosphere. Any vinyl can be forced to burn by continuous application of heat. When forced to burn, the primary combustion products will be hydrogen chloride gas, carbon monoxide and carbon dioxide. Hydrogen chloride gas has a very corrosive effect on many metals. Affected surfaces should be washed to remove corrosive deposits as soon as possible after depositions have occurred.
